

§ 8.3 - Trigonometric Integrals

We'll begin by looking at integrals of the form

$$\int \sin^m x \cos^n x \, dx$$

where m and n are non-negative integers.

Warm up: $\int \sin^m x \cos x \, dx$

Sub $u = \sin x$, $du = \cos x \, dx$ to get $\int u^m \, du$
(Easy!)

What about $\int \sin^m x \cos^3 x \, dx$?

Again, sub $u = \sin x$, $du = \cos x \, dx$ to get

$$\begin{aligned} \int u^m \cos^2 x \cdot \cos x \, dx &= \int u^m (1 - \sin^2 x) \, du \\ &= \int u^m (1 - u^2) \, du \quad (\text{Easy!}) \end{aligned}$$

This strategy will work whenever n is odd! If instead m is odd, we'll set $u = \cos x$.

Strategy for Evaluating $\int \sin^m x \cos^n x dx$

- (i) If m is odd, let $u = \cos x$.
- (ii) If n is odd, let $u = \sin x$.
- (iii) If m & n are even, use the identities

$$\sin^2 x = \frac{1}{2}(1 - \cos 2x), \quad \cos^2 x = \frac{1}{2}(1 + \cos 2x).$$

If both are odd, let u be the function with the higher power!

Note: These identities can be derived by rearranging the cosine double angle identities

$$\cos 2x = 1 - 2\sin^2 x \quad \text{and} \quad \cos 2x = 2\cos^2 x - 1.$$

Ex: (a) $\int \sin^3 x \cdot \cos^8 x dx$

Solution: m odd $\Rightarrow u = \cos x$, $du = -\sin x dx$, giving

$$\begin{aligned}
\int \sin^2 x \cdot u^8 \cdot \underbrace{\sin x dx}_{=-du} &= - \int (1 - \cos^2 x) \cdot u^8 du \\
&= - \int (1 - u^2) u^8 du \\
&= \int (u^{10} - u^8) du \\
&= \frac{u^{11}}{11} - \frac{u^9}{9} + C \\
&= \boxed{\frac{\cos^{11} x}{11} - \frac{\cos^9 x}{9} + C}
\end{aligned}$$

$$(b) \int \sin^{15} x \cdot \cos^5 x dx$$

Solution: Both powers are odd, but $\sin x$ has the bigger power. Let $u = \sin x$, $du = \cos x dx$, giving

$$\int u^{15} \cos^4 x \cdot \underbrace{\cos x dx}_{=du} = \int u^{15} (1 - u^2)^2 du$$

If instead we used $u = \cos x$, we'd need to expand $(1 - u^2)^7 \dots$ Ew.

$$= \int u^{15} (1 - 2u^2 + u^4) du$$

$$= \int (u^{15} - 2u^{17} + u^{19}) du$$

$$= \frac{u^{16}}{16} - \frac{2u^{18}}{18} + \frac{u^{20}}{20} + C$$

$$= \frac{\sin^{16} x}{16} - \frac{\sin^{18} x}{9} + \frac{\sin^{20} x}{20} + C$$

$$(c) \int \sin^2 x \cos^2 x \, dx$$

Solution: Both powers are even, so use the double angle identities.

$$\int \sin^2 x \cos^2 x \, dx = \int \frac{1}{2} (1 - \cos 2x) \cdot \frac{1}{2} (1 + \cos 2x) \, dx$$

$$= \frac{1}{4} \int (1 - \cos^2(2x)) \, dx$$

$$= \frac{1}{4} \int \left(1 - \frac{1}{2} (1 + \cos 4x) \right) \, dx$$

$$= \frac{1}{4} \int \left(\frac{1}{2} - \frac{\cos 4x}{2} \right) \, dx$$

$$= \frac{1}{8} \int (1 - \cos 4x) dx$$

could do a u-sub (u=4x) or note that $\int \cos(nx) dx = \frac{\sin(nx)}{n} + C!$

$$= \boxed{\frac{1}{8} \left(x - \frac{\sin 4x}{4} \right) + C}$$

Let's now look at integrals of the form

$$\int \tan^m x \cdot \sec^n x dx$$

where again, m and n are non-negative integers.

Strategy for Evaluating $\int \tan^m x \sec^n x dx$

(i) If n is even, let $u = \tan x$
and use $\sec^2 x = \tan^2 x + 1$.

(ii) If m is odd, let $u = \sec x$
and use $\tan^2 x = \sec^2 x - 1$.

If n is even
and m is odd,
let u be the
function with
the higher power!

Ex: $\int \tan^3 x \sec^7 x \, dx$

Solution: m is odd, so let $u = \sec x$. We have

$du = \sec x \tan x \, dx$, hence

$$\int \tan^3 x \sec^7 x \, dx = \int \tan^2 x \sec^6 x \cdot \underbrace{\sec x \tan x \, dx}_{du}$$

$$= \int (\sec^2 x - 1) u^6 \, du$$

$$= \int (u^2 - 1) u^6 \, du$$

$$= \int (u^8 - u^6) \, du$$

$$= \frac{u^9}{9} - \frac{u^7}{7} + C = \boxed{\frac{\sec^9 x}{9} - \frac{\sec^7 x}{7} + C}$$

Ex: $\int \tan^4 x \sec^4 x \, dx$

Solution: n is even, so let $u = \tan x$, $du = \sec^2 x \, dx$.

We have

$$\begin{aligned}
\int \tan^4 x \sec^4 x \, dx &= \int \tan^4 x \sec^2 x \cdot \underbrace{\sec^2 x \, dx}_{du} \\
&= \int u^4 (\tan^2 x + 1) \, du \\
&= \int u^4 (u^2 + 1) \, du \\
&= \int (u^6 + u^4) \, du \\
&= \frac{u^7}{7} + \frac{u^5}{5} + C = \boxed{\frac{\tan^7 x}{7} + \frac{\tan^5 x}{5} + C}
\end{aligned}$$

What about cases like $\int \tan^2 x \sec x \, dx$

where m is even and n is odd?

Step 1: Use $\tan^2 x = \sec^2 x - 1$ to get only powers of $\sec x$:

$$\int \tan^2 x \sec x \, dx = \int (\sec^2 x - 1) \cdot \sec x \, dx = \int (\sec^3 x - \sec x) \, dx$$

Step 2: Integrate powers of $\sec x$ as follows:

$$\int \sec x \, dx = \ln |\sec x + \tan x| + C$$

$$\int \sec^2 x \, dx = \tan x + C$$

and for integers $n \geq 3$,

$$\int \sec^n x \, dx = \frac{1}{n-1} \sec^{n-2} x \tan x + \frac{n-2}{n-1} \int \sec^{n-2} x \, dx$$

(This is called a "reduction formula" for powers of secant.

See end of notes for a proof!)

Example using the Reduction Formula:

$$\begin{aligned} \int \sec^4 x \, dx &= \frac{1}{3} \sec^2 x \tan x + \frac{2}{3} \int \sec^2 x \, dx \\ &= \frac{1}{3} \sec^2 x \tan x + \frac{2}{3} \tan x + C \end{aligned}$$

Okay, back to our original problem!

Ex: $\int \tan^2 x \sec x \, dx$

Solution: $\int \tan^2 x \sec x \, dx = \int (\sec^3 x - \sec x) \, dx$

$$= \int \sec^3 x \, dx - \int \sec x \, dx$$

$$= \left[\frac{1}{2} \sec x \tan x + \frac{1}{2} \int \sec x \, dx \right] - \int \sec x \, dx$$

↑ Reduction formula!

$$= \frac{1}{2} \sec x \tan x - \frac{1}{2} \int \sec x \, dx$$

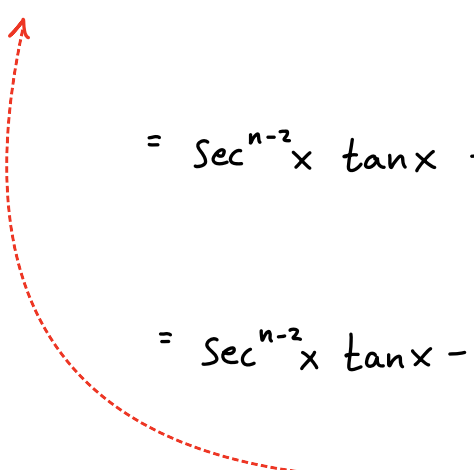

$$= \boxed{\frac{1}{2} \sec x \tan x - \frac{1}{2} \ln |\sec x + \tan x| + C}$$

Appendix: Proof of the Reduction Formula

To calculate $\int \sec^n x dx$, use IBP with

$u = \sec^{n-2} x$	$v = \tan x$
$du = (n-2) \sec^{n-3} x \cdot \sec x \tan x dx$ $= (n-2) \sec^{n-2} x \tan x dx$	$dv = \sec^2 x dx$

$$\begin{aligned}\int \sec^n x dx &= \sec^{n-2} x \tan x - \int (n-2) \sec^{n-2} x \tan^2 x dx \\&= \sec^{n-2} x \tan x - (n-2) \int \sec^{n-2} x (\sec^2 x - 1) dx \\&= \sec^{n-2} x \tan x - (n-2) \int \sec^n x dx + (n-2) \int \sec^{n-2} x dx\end{aligned}$$

 This is a multiple of the original integral! Move to LHS!

$$\Rightarrow (n-1) \int \sec^n x dx = \sec^{n-2} x \tan x + (n-2) \int \sec^{n-2} x dx$$

$$\Rightarrow \int \sec^n x dx = \frac{1}{n-1} \sec^{n-2} x \tan x + \frac{n-2}{n-1} \int \sec^{n-2} x dx$$
